

SMS++: a Structured Modelling System with Applications to Everything

Antonio Frangioni¹

¹Dipartimento di Informatica, Università di Pisa

23rd Combinatorial Optimization Workshop
Aussois (France), January 8, 2019

Your favourite structure
HERE

... you spot your favourite structure!

Your favourite structure HERE

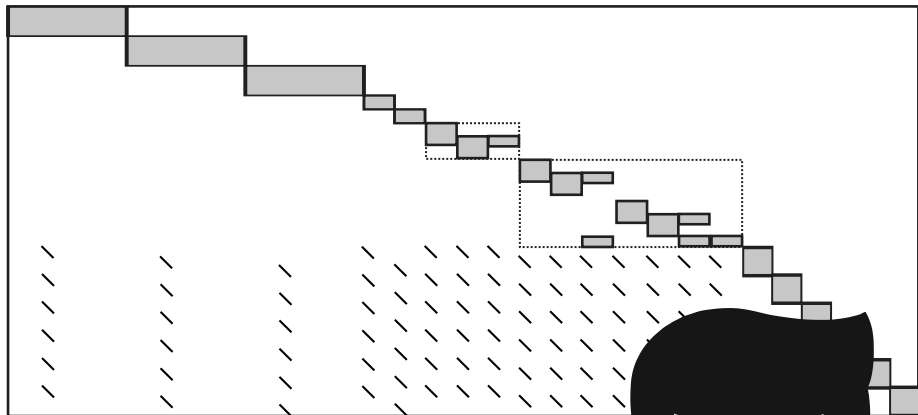

... you spot your favourite structure!

And you **are very happy**

... you discover it's there **many times**,
with **linking constraints**.

... you discover it's there **many times**,
with **linking constraints**.

But you still **are quite happy**

... that was the **operational problem** but you must solve the **tactical one** \equiv that **many time over**

... that was the **operational problem** but you must solve the **tactical one** \equiv that **many time over** you are not so sure you are still happy.

... There's **uncertainty** and you must do **scenarios**.

You might still get to Benders'/Lagrange, but

... There's **uncertainty** and you must do **scenarios**.

You might still get to Benders'/Lagrange, but

... you are most definitely not so very happy.

Of course what they really want to solve is the
strategic problem \equiv that **many time over again**

Of course what they really want to solve is the **strategic problem** \equiv that **many time over again**
You are positively desperate.

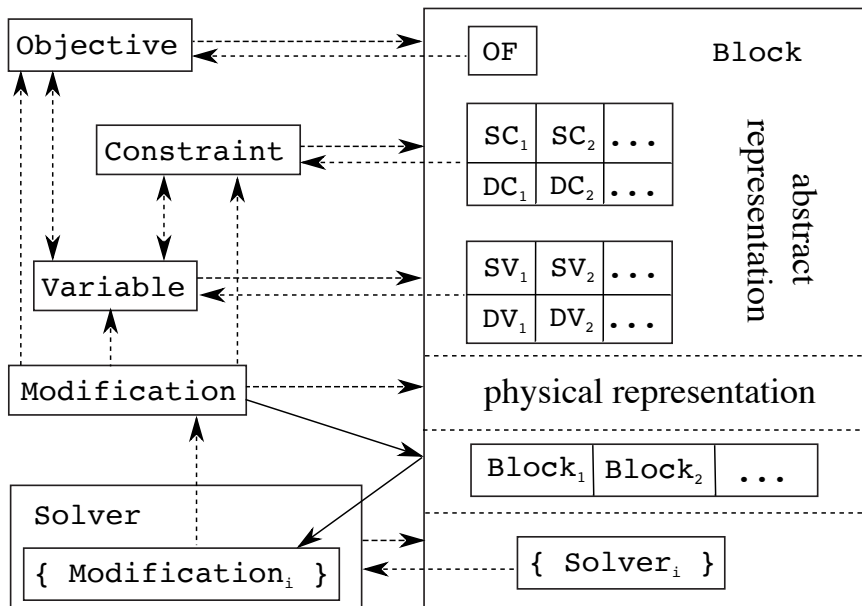

**Wh  Ya
Gonna
Call?**

5M5++

A set of C++ classes implementing a **modelling system** that:

- explicitly supports the notion of **block \equiv nested structure**
- separately provides “semantic” information from “syntactic” details (list of constraints/variables \equiv **one specific** formulation among many)
- allows exploiting **specialised solvers** on blocks with specific structure
- manages **dynamic changes in the model** beyond “just” generation of constraints/variables
- manages **reformulation/restriction/relaxation**
- does **parallel (almost)** from the start
- **should** be able to deal with almost anything (bilevel, PDE, ...)

- A way to make our own model/algorithms readily available to others
⇒ be used a lot more

- A way to make our own model/algorithms readily available to others
⇒ be used a lot more
- A way to make multi-level, heterogeneous decomposition possible
⇒ increase a lot the addressable market of decomposition

- A way to make our own model/algorithms readily available to others
⇒ be used a lot more
- A way to make multi-level, heterogeneous decomposition possible
⇒ increase a lot the addressable market of decomposition
- A way to solve more challenging real-world application
⇒ increase our own relevance in the real world

- A way to make our own model/algorithms readily available to others
⇒ be used a lot more
- A way to make multi-level, heterogeneous decomposition possible
⇒ increase a lot the addressable market of decomposition
- A way to solve more challenging real-world application
⇒ increase our own relevance in the real world
- Lots of implementation fun
